Table of Contents

Instruction Formats	7
Register Specifiers	7
Constant Interpretation for Float Instructions	7
Vector Instruction Indicator	8
Root Opcode	8
Extended Immediate	8
Register Formats	9
R1 (one source register)	9
R2 (two source register)	9
Branch Instructions	10
Instruction Modifiers	10
IMOD Instruction Modifier - 58	10
Branch Modifier – 5A	10
Stride Modifier – 5C	10
Example Instruction	11
Instructions.....	12
Arithmetic / Logical	12
ABS – Absolute Value.....	12
ADD - Addition	14
AND – Bitwise And.....	16
BMM – Bit Matrix Multiply	17
BYTNDX – Byte Index	18
CMP – Compare	20
CNTPOP – Count Population	22
CNTLZ – Count Leading Zeros	23
COM – Ones Complement.....	24
DEP – Deposit.....	25
DIF – Difference	26
DIV – Division.....	27

DIVR – Division	28
DIVSU – Division Signed-Unsigned	29
DIVU – Division Unsigned	30
EOR – Bitwise Exclusive Or	30
EXIn – Extended Immediate	31
EXT –Extract Bitfield	32
EXTU –Extract Bitfield Unsigned	33
FDP – Fused Dot Product	33
FFO –Find First One	34
MAX – Maximum Value	35
MIN – Minimum Value	36
MOD – Instruction Modifier	37
MUL – Multiply	39
MULF – Fast Unsigned Multiply	40
MULU – Unsigned Multiply	41
MUX – Multiplex	42
NABS –Negative Absolute Value	43
NEG - Negate	44
NOT – Logical Not	45
OR – Bitwise Or	46
PERM – Permute Bytes	47
PTRDIF – Difference Between Pointers	48
SEQ – Set if Equal	49
SGE – Set if Greater Than or Equal	51
SGEU – Set if Greater Than or Equal Unsigned	52
SGT – Set if Greater Than	53
SGTU – Set if Greater Than Unsigned	54
SIGN – Sign (Compare to Zero)	55
SLL –Shift Left Logical	56
SLLP –Shift Left Logical Pair	57
SLT – Set if Less Than	58
SLE – Set if Less Than or Equal	59
SLEU – Set if Less Than or Equal	59

SLTU – Set if Less Than Unsigned	61
SNE – Set if Not Equal	62
SQRT – Square Root	63
SRA –Shift Right Arithmetic Pair	64
SRL –Shift Right Logical	65
SRLP –Shift Right Logical Pair.....	66
SUB - Subtract	67
SUBF – Subtract From.....	68
U21NDX – UTF21 Index	71
WYDNDX – Wyde Index.....	72
XOR – Bitwise Exclusive Or	73
ZXB –Zero Extend Byte	74
ZXW –Zero Extend Wyde	74
ZXT –Zero Extend Tetra.....	75
Graphics	76
BLEND – Blend Colors	77
TRANSFORM – Transform Point.....	79
RW_COEEF – Read/Write Co-efficient.....	80
Memory Operations	81
CACHE – Cache Command	81
LDx – Load	82
LDB – Load Byte (8 bits)	85
LDBZ – Load Byte, Zero Extend (8 bits)	85
LDO – Load Octa (64 bits)	86
LDT – Load Tetra (32 bits).....	87
LDTZ – Load Tetra, Zero Extend (32 bits).....	87
LDW – Load Wyde (16 bits)	88
LDWZ – Load Wyde, Zero Extend (16 bits)	88
LEA – Load Effective Address.....	89
STx – Store	91
STB – Store Byte (8 bits).....	94
STBZ – Store Byte and Zero (8 bits)	94
STO – Store Octa (64 bits).....	96

STOZ – Store Octa and Zero (64 bits).....	96
STPTR – Store Pointer (64 bits)	97
STT – Store Tetra (32 bits)	98
STTZ – Store Tetra and Zero (32 bits).....	98
STW – Store Wyde (16 bits).....	98
STWZ – Store Wyde and Zero (16 bits)	98
Flow Control (Branch Unit) Operations	100
Branches.....	100
BAL – Branch and Link.....	100
BBS – Branch if Bit Set	101
BEQ – Branch if Equal	102
BGE – Branch if Greater Than or Equal	103
BGEU – Branch if Greater Than or Equal Unsigned.....	104
BGT – Branch if Greater Than	105
BGTU – Branch if Greater Than Unsigned	106
BNE – Branch if Not Equal	107
BLE – Branch if Less Than or Equal	108
BLEU – Branch if Less Than or Equal Unsigned.....	109
BLT – Branch if Less Than.....	110
BLTU – Branch if Less Than Unsigned	111
BRA – Unconditional Branch.....	112
BSR – Unconditional Branch to Subroutine	112
CHK – Check Register Against Bounds	114
JAL – Jump and Link.....	116
JALR – Jump and Link to Register.....	117
JMP – Jump.....	118
RET – Return from Subroutine.....	Error! Bookmark not defined.
System Instructions.....	126
BRK – Break.....	126
CSRx – Control and Special / Status Access	128
PEEK – Peek at Queue / Stack.....	129
PFI – Poll for Interrupt.....	133
POP – Pop from Queue / Stack.....	134

PUSH – Push on Queue / Stack	134
REX – Redirect Exception.....	136
RTE – Return from Exception	138
STAT – Get Status of Queue / Stack	140
SYNC -Synchronize.....	141
TLBRW – Read / Write TLB.....	143
WFI – Wait for Interrupt.....	144
Vector Specific Instructions.....	145
MFILL –Mask Fill	145
MFIRST – Find First Set Bit.....	145
MFM – Move from Mask	147
MFVL – Move from Vector Length	147
MLAST – Find Last Set Bit.....	148
MTM – Move to Mask.....	149
MTVL – Move to Vector Length.....	150
Arithmetic / Logical	151
V2BITS	151
VBITS2V	152
VCIDX – Compress Index.....	153
VCMRSS – Compress Vector	154
VEINS / VMOVSV – Vector Element Insert	155
VEX / VMOVSV – Vector Element Extract	156
VSCAN.....	157
VSLLV – Shift Vector Left Logical	158
VSRLV – Shift Vector Right Logical.....	159
Memory Operations	160
CVLDx – Compressed Vector Load.....	160
CVSTx – Compressed Vector Store	162
Root Opcode Map.....	164
{R1} Integer Monadic Register Ops – Func ₁₀	165
{R2} Integer Dyadic Register Ops – Func ₇	165
{R3} Triadic Register Ops.....	166
{F1} Floating-Point Monadic Ops – Funct ₇	166

{F2} Floating-Point Dyadic Ops – Funct ₇	166
{F3} Floating-Point Dyadic Ops – Funct ₇	167
{VM} Vector Mask Register Ops.....	168
{OSR2} System Ops.....	169

Instruction Formats

ANY1 has relatively few instruction formats. The instruction format is a fixed 36-bits in size. It is highly desirable to keep the instruction size to a minimum as minimally sized instructions have better entropy characteristics. The instruction format contains more decode information than is present in some instruction sets. Particularly there are register type codes associated with register spec fields. This is to keep the size of the instruction decoder hardware to a minimum. Otherwise, a ginormous decoder would be required to handle all possible combinations of instructions and types of registers. A vector machine that supports multiple primitive data types leads to a design that potentially has a lot of variation of instructions.

Register Specifiers

The seven-bit register specifier field of an instruction looks like:

2625	24	20
Tb ₂	Rb ₅	

Register specifiers are always located at the same fixed positions in all instructions. This increases performance and minimizes decoding hardware.

Register specifiers contain a one or two-bit type code and a five-bit register number. The meaning of the type code is in the following table:

Ty ₂	Meaning
0	Scalar register
1	Vector register
2,3	Six-bit constant value (bit 0 of Ty is the high order bit of the constant) Not available for Ra, Rt register specs

Note that allowing either scalar or vector registers to be specified in the register spec eliminates the need for special classes of instructions to handle scalar-scalar, vector-scalar, or vector-vector operations.

For signed operations the six-bit constant is treated as a signed value and extended to 64-bits. For unsigned operations (BLTU, BGEU, SLTU, SGEU,...) the six-bit constant is treated as an unsigned value and zero extended to 64-bits.

Constant Interpretation for Float Instructions

For floating point instructions specifying a constant treats the constant as a positive six-bit floating point constant which is extended to 64-bits before use. The exponent specifies a three-bit range of -3 to +4.

Bits 3 to 4	Bits 0 to 2
3-bit Exponent	3-bit significand

The significand has a hidden leading one bit.

Vector Instruction Indicator

The processing core needs to know if an instruction is a vector instruction before it is fully decoded. Depending on if the instruction is a vector instruction, it may be re-decoded and sent into the pipeline multiple times. The processor needs to know very quickly and simply at the instruction fetch stage if the instruction is a vector operation. So, to help things along ANY1 encodes this information in bit 7 of all instructions. See the sample instruction below.

Immediate Format:

Root Opcode

The root opcode determines the class of instructions executed. Some commonly executed instructions are also encoded at the root level to make more bits available for the instruction. The root opcode is always present in all instructions as the lowest seven bits of the instruction.

Target Register Spec

Most instructions have a target register. The register spec for the target register is always in the same position, bits 8 to 13 of an instruction. The Tt field specifies the target register is a scalar (0) or vector (1) register.

Extended Immediate

The extended immediate instructions extend an immediate constant from bit 11 of the following instruction. Five root opcodes are reserved for extended immediates. See the [EXIn](#) description.

Register Formats

R1 (one source register)

With just one source register spec there is room available in the instruction to encode the vector mask register for vector instructions. This avoids the needs for an instruction modifier.

R2 (two source register)

Branch Instructions

Branch instructions make use of bits 8 to 13, 19 and 27 to 35 to specify a 16-bit branch displacement for a range of $\pm 16kB$. The displacement is in nybbles. Note there are no vector branch instructions. Opcodes that would encode to vector branching are reserved for future use.

35	27	2625	24	20	19	18	14	13	8	7	6	0
Const ₉	Tb ₂	Rb ₅	C	Ra ₅	Const ₆	0	4xh ₇					

Load / Store Multiple

35	20	19	18	14	13	12	8	7	6	0
Constant ₁₆		Ta	Ra ₅		E	~ ₅		v	6Fh ₇	

Instruction Modifiers

IMOD Instruction Modifier - 58

This modifier adds two register spec fields allowing an instruction to use up to four source registers. It also allows a vector mask register to be optionally specified. Rounding mode for instructions supporting rounding is also possible to specify.

35	31	30	28	27	2625	24	20	19	18	14	1312	11	9	8	7	0
~ ₅	Rm ₃	Tc	Td ₂	Rd ₅	Tc	Rc ₅	A	m ₃	z	58h ₈						

A: 00 = ignore mask and round

01 = apply vector mask

10 = apply rounding

11 = apply both vector mask and rounding.

Branch Modifier – 5A

The branch modifier adds a link register to allow storing a return address. This allows conditional subroutine calls. Also, present is a branch target register spec. This allows conditional branching relative to a value in a register. Nineteen additional bits of branch displacement are provided, making the total branch displacement 35 bits or $\pm 8GB$.

35	21	2019	18	14	13	10	9	8	7	6	0
Constant ₁₅	Tc ₂	Rc ₅	Cnst ₄	Rt ₂	0	5Ah ₇					

Stride Modifier – 5B

The stride modifier is used with vector load / store instructions to specify the stride of the operation.

35	21	2019	18	14	1312	11	9	8	7	0
Const ₁₅		Tc ₂	Rc ₅		A	m ₃		z	5Bh ₈	

z: 1 = zero vector element if mask bit clear, 0 = vector element unchanged (ignored for scalar ops)

m₃: vector mask register (ignored for scalar operations).

Rm₃: rounding mode

Register List Modifier – 5C to 5F

The register list modifier specifies a list of registers for the LDM and STM instructions. There is a bit in the list for each register x1 to x30. The REGLIST prefix should be placed before any other prefixes associated with the instruction.

35	8	7	2	1 0
List _{30..3}		010111b ₆		List _{2..1}

Example Instruction

add.int.o x1,x2,x3 ; scalar add of integers x2,x3

add.int.o v1,v2,v3,vm0 ; vector add of integers v2,v3

add.int.o v1,v2,x4,vm0 ; vector add scalar integers v2,x4

add.fp.o v1,v2,v3,vm0 ; vector add float-point double v2,v3

Instructions

Arithmetic / Logical

ABS – Absolute Value

Description:

This instruction takes the absolute value of a register and places the result in a target register.

Integer Instruction Format: R1

Both the source and target registers are treated as integer values.

35	29	28 24	23 21	20	19	18 14	13	12 8	7	6	0
06h ₇	~ ₅	m ₃	z	Ta	Ra ₅	Tt	Rt ₅	v	01h ₇		

v: 0 = scalar, 1 = vector op

Float Instruction Format: R1

Both the source and target registers are treated as float values.

35	29	28 24	23 21	20	19	18 14	13	12 8	7	6	0
20h ₇	~ ₅	m ₃	z	Ta	Ra ₅	Tt	Rt ₅	v	34h ₇		

Decimal Float Instruction Format: R1

Both the source and target registers are treated as decimal float values.

35	29	28 24	23 21	20	19	18 14	13	12 8	7	6	0
20h ₇	~ ₅	m ₃	z	Ta	Ra ₅	Tt	Rt ₅	v	30h ₇		

Posit Instruction Format: R1

Both the source and target registers are treated as posit values.

35	29	28 24	23 21	20	19	18 14	13	12 8	7	6	0
20h ₇	~ ₅	m ₃	z	Ta	Ra ₅	Tt	Rt ₅	v	38h ₇		

Operation:

If $Ra < 0$

$Rt = -Ra$

else

$Rt = Ra$

Vector Operation

for $x = 0$ to $VL - 1$

if ($Vm[x]$) $Rt[x] = Ra[x] < 0 ? -Ra[x] : Ra[x]$

Execution Units: I, F, D, P

Clock Cycles: 1

Exceptions: none

Notes:

For sign-magnitude formats this instruction simply clears the MSB of the number. No rounding occurs.

ADD - Addition

Description:

Add two values. The first operand must be in a register. The second operand may be in a register or may be an immediate value specified in the instruction.

Operation:

$$Rt = Ra + Imm$$

or

$$Rt = Ra + Rb$$

Vector Operation

for $x = 0$ to $VL - 1$

if $(Vm[x]) \quad Vt[x] = Va[x] + Vb[x]$

else if $(z) \quad Vt[x] = 0$

Integer Instruction Format: RI

35	20	19	18	14	13	12	8	7	6	0
Constant ₁₆		Ta	Ra ₅		Tt	Rt ₅		v	04h ₇	

1 clock cycle / N clock cycles (N = vector length)

Integer Instruction Format: R2

Vector Mask Instruction Format: R2 (MADD)

35	29	28	25	24	22	21	18	17	15	14	11	10	8	7	0
04h ₇	0 ₄	Vmb ₃	0 ₄	Vma ₃	0 ₄	Vmt ₃	3Eh ₈								

1 clock cycle

Exceptions: none

ADDIP – Add to Instruction Pointer

Description:

Add an immediate value to the instruction pointer and store the result in Rt. The immediate value is shifted by 14 bits to the left and zero extended to the right before use. This corresponds with the size of a memory page.

Operation:

$$Rt = IP + Imm \ll 14$$

Integer Instruction Format: RI

35	20	19	14	13	12	8	7	6	0
Constant _{15..0}	Cnst _{21..16}	Tt	Rt ₅	v	0Ch ₇				

1 clock cycle / N clock cycles (N = vector length)

Exceptions: none

AND – Bitwise And

Description:

Perform a bitwise ‘and’ operation between operands. The first operand must be in a register. The second operand may be in a register or may be an immediate value specified in the instruction. The immediate constant is one extended before use.

Integer Instruction Format: RI

35	20	19	18	14	13	12	8	7	6	0
Constant ₁₆	Ta	Ra ₅	Tt	Rt ₅	v	08h ₇				

1 clock cycle / N clock cycles (N = vector length)

Integer Instruction Format: R2

35	29	28	27	26	25	24	20	19	18	14	13	12	8	7	6	0
00h ₇	~ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v	02h ₇							

1 clock cycle / N clock cycles (N = vector length)

Vector Mask Instruction Format: R2 (MADD)

35	29	28	25	24	22	21	18	17	15	14	11	10	8	7	0
00h ₇	0 ₄	Vmb ₃	0 ₄	Vma ₃	0 ₄	Vmt ₃	3Eh ₈								

1 clock cycle

Operation:

$R_t = R_a \& \text{Imm}$

or

$R_t = R_a \& R_b$

Vector Operation

for $x = 0$ to $VL - 1$

if $(V_m[x]) \ V_t[x] = V_a[x] \& V_b[x]$

else if $(z) \ V_t[x] = 0$

Exceptions: none

BMM – Bit Matrix Multiply

BMM Rt, Ra, Rb

Description:

The BMM instruction treats the bits of register Ra and register Rb as an 8x8 matrix and performs a bit matrix multiply of the two registers and stores the result in the target register. An alternate mnemonic for this instruction is MOR.

Instruction Format: R2

35	29	2827	2625	24	20	19	18	14	13	12	8	7	6	0
func ₇	~ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v	02h ₇					

Fn ₇	Function
30h	MOR
31h	MXOR
32h	MORT (MOR transpose)
33h	MXORT (MXOR transpose)

Operation:

for I = 0 to 7

for j = 0 to 7

$$Rt.bit[i][j] = (Ra[i][0] \& Rb[0][j]) \mid (Ra[i][1] \& Rb[1][j]) \mid \dots \mid (Ra[i][15] \& Rb[15][j])$$

Clock Cycles: 1

Execution Units: Integer ALU

Exceptions: none

Notes:

The bits are numbered with bit 63 of a register representing I_j = 0,0 and bit 0 of the register representing I_j = 7,7.

BYTNDX – Byte Index

Description:

This instruction searches Ra, which is treated as an array of eight bytes, for a byte value specified by Rb or an immediate value and places the index of the byte into the target register Rt. If the byte is not found -1 is placed in the target register. A common use would be to search for a null byte. The index result may vary from -1 to +7. The index of the first found byte is returned (closest to zero).

If a vector BYTNDX instruction is issued and the target is a scalar register then the instruction searches all the vector elements and returns a value which varies from -1 to +511 in the scalar register. Thus, BYTNDX may be used to determine the length of a null termination string in the vector register.

Instruction Format: R2

35 32	31 27	26 25	24 20	19	18 14	13	12 8	7	6	0
0 ₄	~ ₅	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v	1A ₇	

35 32	31	20	19	18 14	13	12 8	7	6	0
1 ₄	Constant ₁₂		Ta	Ra ₅	Tt	Rt ₅	v	1A ₇	

R2 Supported Formats: .o

Clock Cycles: 1

Execution Units: Integer ALU

Operation:

Rt = Index of (Rb in Ra)

Exceptions: none

CMOVNZ – Conditional Move

Description:

CMOVNZ moves a value from Ra or Rb depending on the value in Rc. If Rc is true then Ra is moved to Rt, otherwise Rb is moved to Rt.

Instruction Format: R2

35 31	30 28	27	26 25	24 20	19	18 14	13 12	11 9	8	7	0
~ ₅	~ ₃	Tc	~ ₂	~ ₆	Tc	Rc ₅	A	m ₃	z		58h ₈

35	29	28 27	26 25	24 20	19	18 14	13	12 8	7	6	0
06h ₇	~ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v			03h ₇

Exceptions: none

Execution Units: integer ALU

CMP – Compare

Description

Compare two registers or a register and an immediate value and return the relationship between them.

Integer Instruction Format: R2

Both values are treated as signed numbers.

35	29	2827	2625	24	20	19	18	14	13	12	8	7	6	0
20h ₇	~ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v						02h ₇

1 clock cycle

Operation:

$Rt = Ra < Rb ? -1 : Ra = Rb ? 0 : 1$

Vector Operation

for $x = 0$ to $VL - 1$

if $(Vm[x]) \quad Vt[x] = Va[x] < Vb[x] ? -1 : Va[x] = Vb[x] ? 0 : 1$

Float Instruction Format: R2 (FCMP)

Both values are treated as double precision (64-bit) floating point numbers. The result is returned as a float value of -1.0, 0.0 or +1.0. If the comparison is unordered 2.0 is returned.

35	29	2827	2625	24	20	19	18	14	13	12	8	7	6	0
10h ₇	~ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v	35h ₇					

1 clock cycle

Float Instruction Format: R2 (FCMPB)

Both values are treated as double precision (64-bit) floating point numbers. The value returned is a bit vector as outlined in the table below. Note that the less than status is returned in both bits 1 and 63 so that a BLT may be used.

35	29	2827	2625	24	20	19	18	14	13	12	8	7	6	0
15h ₇	~ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v	35h ₇					

1 clock cycle

The float comparison returns a bit vector containing the status of all possible relationships. This may then be tested with the BBS instruction.

Rt bit	Meaning
0	= equal
1	< less than
2	<= less than or equal
3	< magnitude less than
4	unordered
5 to 7	zero (reserved)
8	< > not equal
9	>= greater than or equal
10	> greater than
11	>= magnitude greater than or equal
12	ordered
13 to 62	zero (reserved)
63	less than

Decimal Float Instruction Format: R2 (DFCMP)

Both values are treated as double precision (64-bit) decimal floating-point numbers. The result is returned as a float value of -1.0, 0.0 or +1.0. If the comparison is unordered 2.0 is returned.

35	29	2827	2625	24	20	19	18	14	13	12	8	7	6	0
10h ₇	~ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v	31h ₇					

1 clock cycle

CNTPOP – Count Population

CNTPOP r1,r2

CNTPOP v1,v2

CNTPOP r1,vm2

Description:

Count the number of ones and place the count in the target register.

Vector Operation

for x = 0 to VL - 1

if (Vm[x]) Vt[x] = popcnt(Va[x])

Instruction Format: R1

35	29	28 24	23 21	20	19	18 14	13	12 8	7	6	0
02h ₇	~ ₅	m ₃	z	Ta	Ra ₅	Tt	Rt ₅	v	01h ₇		

Vector Mask Instruction Format: R1

35	26	25 22	21 18	17 15	14 13	12 8	7	0
0Dh ₁₀	~ ₄	0 ₅	Vm ₃	Tt ₂	Rt ₅	3Eh ₈		

Execution Units: integer ALU

Exceptions: none

CNTLZ – Count Leading Zeros

Description:

Count the number of leading zeros (starting at the MSB) in Ra and place the count in the target register.

Instruction Format: R1

35	29	28 24	23 21	20	19	18 14	13	12 8	7	6	0
00h ₇	~ ₅	m ₃	z	Ta	Ra ₅	Tt	Rt ₅	v	01h ₇		

Vector Mask Instruction Format: R1

35	26	25 22	21 18	17 15	14 13	12 8	7	0
00h ₁₀	~ ₄	0 ₅	Vm ₃	Tt ₂	Rt ₅	3Eh ₈		

R1 Supported Formats: .o

Clock Cycles: 1

Execution Units: Integer ALU

Exceptions: none

COM – Ones Complement

Description:

Bitwise complement all the bits in the register. 1's become 0's and 0's become 1's.

Instruction Format: R1

35	29	28 24	23 21	20	19	18 14	13	12 8	7	6	0
03h ₇	~ ₅	m ₃	z	Ta	Ra ₅	Tt	Rt ₅	v	01h ₇		

1 clock cycle

Operation

$$Rt = \sim Ra$$

Vector Operation

for x = 0 to VL-1

if (Vm[x]) Vt[x] = $\sim Va[x]$

else if (z) Vt[x] = 0

else Vt[x] = Vt[x]

Exceptions: none

DEP – Deposit

Description:

Insert to a bitfield. Rc specifies the bitfield offset, Rd specifies the width of the bitfield. Rb specifies the data to insert. Ra contains the original source data. The least significant Rd minus one bits of Rb are inserted into Ra at the position specified by Rc. The final result is placed into Rt.

This instruction may also be used to perform a left shift of a single register by specifying x0 for Ra.

Formats Supported: R4

31 29	28 26	25 20	19 14	13 12	11 9	8	7	0
DT ₃	Rm ₃	Rc ₆	Rd ₆	A	m ₃	z	5	9h ₈

31 26	25 20	19 14	13 8	7	0
3 ₆	Rb ₆	Ra ₆	Rt ₆	1	Ch ₈

DT ₃	Meaning
00	Rc,Rd are both regs
01	Rc is a six bit immediate, Rd is a reg
10	Rd is a six bit immediate, Rc is a reg
11	Both Rc, Rd are six bit immediates

Operation Size: .o

Execution Units: integer ALU

Exceptions: none

Example:

DIF – Difference

Description:

This instruction computes the difference between two signed values in registers Ra and Rb and places the result in a target Rt register. The difference is calculated as the absolute value of Ra minus Rb.

Instruction Format: R2

35	29	2827	2625	24	20	19	18	14	13	12	8	7	6	0
18h ₇	~ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v	02h ₇					

Supported Formats: .o

Clock Cycles: 1

Execution Units: Integer

Operation:

$$Rt = \text{Abs}(Ra - Rb)$$

Exceptions: none

DIV[O][Z] – Division

Description:

Divide two operand values and place the result in the target register. The first operand must be in a register specified by the Ra field of the instruction. The second operand may be a register specified by the Rb field of the instruction or an immediate value. Both operands are treated as signed values. The register form of this instruction may cause a divide by zero exception if enabled in the instruction.

Instruction Format: RI

35	20	19	18	14	13	12	8	7	6	0
Constant ₁₆	Ta	Ra ₅	Tt	Rt ₅	v	10h ₇				

Instruction Format: R2

35	29	28	27	26	25	24	20	19	18	14	13	12	8	7	6	0
10h ₇	OZ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v	02h ₇							

Float Instruction Format: R2

35	29	28	27	26	25	24	20	19	18	14	13	12	8	7	6	0
09h ₇	~ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v	35h ₇							

Execution Units: ALU

Clock Cycles: 20

Exceptions: none

DIVR – Division

Description:

This instruction is supplied as division is not commutative. Divide two operand values and place the result in the target register. The first operand must be an immediate value. The second operand must be a register specified by the Ra field of the instruction. Both operands are treated as signed values. This instruction allows a constant to be divided by a register value “reverse” to how the DIV instruction works.

Integer Instruction Format: RI

35	20	19	18	14	13	12	8	7	6	0
Constant ₁₆		Ta	Ra ₅		Tt	Rt ₅		v	21h ₇	

Execution Units: ALU

Clock Cycles: 20

Exceptions: none

DIVSU – Division Signed-Unsigned

Description:

Divide two operand values and place the result in the target register. The first operand must be in a register specified by the Ra field of the instruction. The second operand may be either a register specified by the Rb field of the instruction, an immediate value. The first operand is treated as a signed value, the second operand as unsigned.

Instruction Format: RI

35	20	19	18	14	13	12	8	7	6	0
Constant ₁₆	Ta	Ra ₅	Tt	Rt ₅	v	12h ₇				

Instruction Format: R2

35	29	28	27	26	25	24	20	19	18	14	13	12	8	7	6	0
12h ₇	OZ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v	02h ₇							

Execution Units: ALU

Clock Cycles: 20

Exceptions: none

DIVU – Division Unsigned

Description:

Divide two operand values and place the result in the target register. The first operand must be in a register specified by the Ra field of the instruction. The second operand may be either a register specified by the Rb field of the instruction, an immediate value. Both operands are treated as unsigned values.

Instruction Format: RI

35	20	19	18	14	13	12	8	7	6	0
Constant ₁₆	Ta	Ra ₅	Tt	Rt ₅	v	11h ₇				

Instruction Format: R2

35	29	28	27	26	25	24	20	19	18	14	13	12	8	7	6	0
11h ₇	~ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v	02h ₇							

Execution Units: ALU

Clock Cycles: 20

Exceptions: none

EOR – Bitwise Exclusive Or

Description:

This is an alternate mnemonic for the [XOR](#) instruction. Perform a bitwise exclusive or operation between operands. The first operand must be in a register. The second operand may be a register or immediate value. The immediate constant is zero extended before use.

EXIn – Extended Immediate

Description:

These instructions are used to extend the constant field of the following instruction. The constant is extended from bit eleven. Multiple constant extensions may be present to extend a constant up to 64 bits. When multiple extensions are present they should be placed in order least significant to most significant. (EXI0 first, EXI1 second, EXI2 third). The constant extensions sign-extend to the width of the machine.

Constant extensions may be applied for most instructions with a constant field.

Interrupts are locked out between the modifier and the following instruction.

Instruction Format: EXI

EXT –Extract Bitfield

Description:

A bitfield is extracted from the source by shifting the source to the right and ‘and’ masking. The result is sign extended to the width of the machine. This instruction may be used to sign extend a value from an arbitrary bit position. The width specified should be one less than the desired width. The source is value is contained in the register pair Ra, Rb. The field width is specified by Rc and field offset by Rd.

Instruction Format: R4

35	31	30	28	27	26	25	24	20	19	18	14	13	12	11	9	8	7	0
~ ₅	Rm ₃	Tc	Td ₂	Rd ₅	Tc	Rc ₅	A	m ₃	z	58h ₈								

35	29	2827	2625	24	20	19	18	14	13	12	8	7	6	0
04h ₇	~ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v	1Ch ₇					

Execution Units: Integer ALU

Exceptions: none

Notes:

37h ₇	~ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v	03h ₇					

FFO –Find First One

Description:

A bitfield contained in Ra is searched beginning at the most significant bit to the least significant bit for a bit that is set. The index into the bitfield of the bit that is set is stored in Rt. If no bits are set, then Rt is set equal to -1. The field offset is specified by Rc, the field width by Rd.

Instruction Format: R4

35	31	30	28	27	26	25	24	20	19	18	14	13	12	11	9	8	7	0
~ ₅	Rm ₃	Tc	Td ₂	Rd ₆	Tc	Rc ₅	A	m ₃	z	58h ₈

06h ₇	~ ₂	~ ₂	~ ₅	Ta	Ra ₅	Tt	Rt ₅	v	1Ch ₇					

DT ₃	Meaning
00	Rc,Rd are both regs
01	Rc is a six bit immediate, Rd is a reg
10	Rd is a six bit immediate, Rc is a reg
11	Both Rc, Rd are six bit immediates

Clock Cycles:

Execution Units: Integer

Exceptions: none

MAX – Maximum Value

Description:

Determines the maximum of two values in registers Ra, Rb and places the result in the target register Rt.

Integer Instruction Format: R2

35	29	2827	2625	24	20	19	18	14	13	12	8	7	6	0
29h ₇	~ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v	02h ₇					

Float Instruction Format: R2

35	29	2827	2625	24	20	19	18	14	13	12	8	7	6	0
03h ₇	~ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v	35h ₇					

Operation:

```

IF Ra > Rb
    Rt = Ra
else
    Rt = Rb
  
```

MIN – Minimum Value

Description:

Determines the minimum of two values in registers Ra, Rb and places the result in the target register Rt.

Integer Instruction Format: R2

35	29	2827	2625	24	20	19	18	14	13	12	8	7	6	0
28h ₇	~ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v	02h ₇					

Float Instruction Format: R2

35	29	2827	2625	24	20	19	18	14	13	12	8	7	6	0
02h ₇	~ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v	35h ₇					

Operation:

```

IF Ra < Rb
    Rt = Ra
else
    Rt = Rb
  
```

MOD – Instruction Modifier

Description:

Used to modify the operation of the following instruction. Modifiers 50h to 52h are used to supply additional constant bits and are described as EXI instructions.

Interrupts are locked out between the modifier and the following instruction.

Instruction Format: 58/D8 (IMOD)

35	31	30	28	27	26	25	24	20	19	18	14	13	12	11	9	8	7	0
~ ₅		Rm ₃		Tc	Td ₂		Rd ₆		Tc	Rc ₅		A		m ₃		z	58h ₈	

A[0]: 1 = apply vector mask, 0=ignore mask spec

A[1]: 1 = apply rounding mode. 0 = ignored rounding mode spec

There are three basic additional elements supplied for the following instruction.

- 1) A vector mask specification, used only by vector instructions.
- 2) Two additional source registers
- 3) A rounding mode specification, useful only to applicable instructions

Two additional register fields allow up to four source operands for the following instruction. If these registers are not required they should be specified as #0.

Application of the vector mask and rounding mode are optional. Two bits in the 'A' field indicate which of these modifiers is applied.

Instruction Format: 5A (BRMOD)

35	21	20	19	18	14	13	10	9	8	7	6	0
Constant ₁₅				Tc ₂	Rc ₅	Cnst ₄		Rt ₂	0	5Ah ₇		

The 5A modifier applies to branch instructions to both extend the range of a branch and allow branch-to-register, and branch-and-link capability. When the 5A modifier is present, the Rc register overrides the use of the IP in calculating the branch target address. The target address is then the sum of register Rc and a constant supplied in the instruction.

The constant field of the 5A modifier adds an additional nineteen bits to the branch displacement. This allows branching extended to $\pm 8\text{GB}$.

The Rt field may be set to the address of the instruction following the branch, to allow conditional branch to subroutine capability.

Instruction Format: 5C/DC (STRIDE)

35	21	20	19	18	14	13	12	11	9	8	7	0
Const ₁₅				Tc ₂	Rc ₅	A		m ₃	z	5Ch ₈		

This format is used with vector load and store instructions to supply stride information and extend the address range of the load / store. Any additional constant modifiers (EXI0, EXI1, EXI2) should be placed before the stride modifier.

MUL[O] – Multiply

Description:

Multiply two values. The first operand must be in a register. The second operand may be in a register or may be an immediate value specified in the instruction. Both the operands are treated as signed values, the result is a signed result. The register form of the instruction may cause an overflow exception if the overflow enable bit in the instruction is set.

Integer Instruction Format: RI

35	20	19	18	14	13	12	8	7	6	0
Constant ₁₆	Ta	Ra ₅	Tt	Rt ₅	v	06h ₇

25 clock cycles

Execution Units: ALU

Vector Operation

for $x = 0$ to $VL - 1$

if (Vm[x]) $Vt[x] = Va[x] * Vb[x]$

Exceptions: none

MULF – Fast Unsigned Multiply

Description:

Multiply two values. The first operand must be in a register. The second operand may be in a register or may be an immediate value specified in the instruction. Both the operands are treated as unsigned values. The result is an unsigned result. The fast multiply multiplies only the low order 24 bits of the first operand times the low order 16 bits of the second. The result is a 40-bit unsigned product.

Integer Instruction Format: RI

35	20	19	18	14	13	12	8	7	6	0
Constant ₁₆	Ta	Ra ₅	Tt	Rt ₅	v	15h ₇				

1 clock cycle / N clock cycles (N = vector length)

Integer Instruction Format: R2

0Eh ₇	~ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v	02h ₇					

4 clock cycles

Exceptions: none

Vector Operation

for x = 0 to VL - 1

if (Vm[x]) Vt[x] = Va[x] * Vb[x]

Exceptions: none

MUX – Multiplex

Description:

The MUX instruction performs a bit-by-bit copy of a bit of Rb to the target register if the corresponding bit in Ra is set, or a copy of a bit from Rc if the corresponding bit in Ra is clear.

The MUX instruction may be used without the instruction modifier in which case Rc is assumed to be zero.

Instruction Format: R2

35	31	30	28	27	26	25	24	20	19	18	14	13	12	11	9	8	7	0

04h ₇		~ ₂	Tb ₂	Rb ₅		Ta	Ra ₅		Tt	Rt ₅		v	03h ₇	

Exceptions: none

Execution Units: integer ALU

NABS –Negative Absolute Value

Description:

Take the negative absolute value of the number in register Ra and place the result into target register Rt. No rounding of the number occurs.

Integer Instruction Format: R1

Both the source and target registers are treated as integer values.

31	26	25	20	19	14	13	8	7	0
7 ₆	~ ₆	Ra ₆	Rt ₆	01h ₈					

Integer Vector Format: R1

31	26	2524	23 21	20	19	14	13	8	7	0
07h ₆	~ ₂	m ₃	Z	Va ₆	Vt ₆	81h ₈				

Float Instruction Format: R1

Both the source and target registers are treated as float values.

31	26	25	20	19	14	13	8	7	0
21h ₆	~ ₆	Ra ₆	Rt ₆	34h ₈					

Float Vector Format: R1

31	26	2524	23 21	20	19	14	13	8	7	0
21h ₆	~ ₂	m ₃	Z	Va ₆	Vt ₆	B4h ₈				

Operation:

If $Ra < 0$
 $Rt = Ra$
 else
 $Rt = -Ra$

Clock Cycles: 1

Execution Units: Integer, Floating Point

NEG - Negate

Description:

This is an alternate mnemonic for the SUBF instruction where the constant is zero.

Instruction Format: R2

31	20	19 14	13 8	7	0
0 ₁₂	Ra ₆	Rt ₆	05h ₈		

Vector Instruction Format: R2

31	20	19 14	13 8	7	0
0 ₁₂	Va ₆	Vt ₆	85h ₈		

Scalar Operation

$$Rt = 0 - Rb$$

Vector Operation

for $x = 0$ to $VL - 1$

if (Vm[x]) $Vt[x] = 0 - Vb[x]$

else if (z) $Vt[x] = 0$

else $Vt[x] = Vt[x]$

Notes

For sign-magnitude operations the sign bit is inverted, no subtract occurs. The result is not rounded.

NOT – Logical Not

Description:

This instruction takes the logical ‘not’ value of a register and places the result in a target register. If the source register contains a non-zero value, then a zero is loaded into the target. Otherwise, if the source register contains a zero a one is loaded into the target register.

NOT reduces the value to a single bit Boolean.

Integer Instruction Format: R1

35	29	28 24	23 21	20	19	18 14	13	12 8	7	6	0
04h ₇	~ ₅	m ₃	z	Ta	Ra ₅	Tt	Rt ₅	v		01h ₇	

1 clock cycle

Operation:

$$Rt = !Ra$$

Exceptions: none

OR – Bitwise Or

Description:

Perform a bitwise or operation between operands. The immediate constant is zero extended before use.

Integer Instruction Format: RI

35	20	19	18	14	13	12	8	7	6	0
Constant ₁₆	Ta	Ra ₅	Tt	Rt ₅	v	09h ₇

1 clock cycle

Operation

$Rt = Ra \mid \text{Immediate}$

OR

$Rt = Ra \mid Rb$

Vector Operation

for $x = 0$ to $VL-1$

if ($Vm[x]$) $Vt[x] = Va[x] \mid Vb[x] \mid Vc[x]$

Exceptions: none

PERM – Permute Bytes

Description:

This instruction allows any combination of bytes in a source register to be copied to a target register. The low order twenty-four bits of register Rb or a 16-bit immediate constant are used to identify which source bytes are copied to the destination. The twenty-four-bit value is composed of eight three-bit fields. Field S0 indicates the source byte for target byte position 0. S1 indicates the source byte for target byte position 1. S2 to S7 work similarly for the remaining target bytes. There are many interesting possibilities with this instruction. A single source byte could be copied to all target byte positions for instance. Or the order of bytes in a word could be reversed.

Integer Instruction Format: RI

The immediate format is normally used with a constant extension word as 24 bits are required to resolve the target positions.

Execution Units: integer ALU

Clock Cycles: 1

Exceptions: none

PTRDIF – Difference Between Pointers

Description:

Subtract two values then shift the result right. Both operands must be in a register. The right shift is provided to accommodate common object sizes. It may still be necessary to perform a divide operation after the PTRDIF to obtain an index into odd sized or large objects. Rc may vary from zero to thirty-one. This instruction always uses a modifier to supply Rc or an immediate constant.

Integer Instruction Format: R3

35	31	30	28	27	26	25	24	20	19	18	14	13	12	11	9	8	7	0

SEQ – Set if Equal

Float:

31262520	1914	138	7	0
11h ₆	Rb ₆	Ra ₆	Rt ₆	B5h ₈

SGE – Set if Greater Than or Equal

Description:

The set instruction places a 1 or 0 in the target register based on the relationship between the two source operands. If operand Ra is greater than or equal to a second operand in register (Rb) then the target register is set to a one, otherwise the target register is set to a zero. The operands are treated as signed values.

There is no immediate form to this instruction. An immediate equivalent may be achieved using the [SGT](#) instruction and adjusting the constant by one.

Instruction Format: R2

Integer:

35	29	2827	2625	24	20	19	18	14	13	12	8	7	6	0
2Dh ₇	~ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v	02h ₇					

Float:

SGEU – Set if Greater Than or Equal Unsigned

Description:

The set instruction places a 1 or 0 in the target register based on the relationship between the two source operands. If operand Ra is greater than or equal to a second operand in register (Rb) then the target register is set to a one, otherwise the target register is set to a zero. The operands are treated as signed values.

There is no immediate form to this instruction. An immediate equivalent may be achieved using the SGTU instruction and adjusting the constant by one.

Instruction Format: R2

Integer:

35	29	2827	2625	24	20	19	18	14	13	12	8	7	6	0
2Fh ₇	~ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v	02h ₇					

SGT – Set if Greater Than

SGTU – Set if Greater Than Unsigned

Description:

The set instruction places a 1 or 0 in the target register based on the relationship between the two source operands. If operand Ra is greater than a second operand which is a constant supplied in the instruction, then the target register is set to a one, otherwise the target register is set to a zero. The operands are treated as signed values.

There is no register form of this instruction. The register equivalent operation may be performed using the [SLTU](#) instruction and swapping the registers.

Instruction Format: RI

35	20	19	18	14	13	12	8	7	6	0
Constant ₁₆		Ta	Ra ₅		Tt	Rt ₅		v	2Bh ₇	

Integer Instruction Format: R2 (SLTU)

2Eh ₇	~ ₂	Ta ₂	Ra ₅	Tb	Rb ₅	Tt	Rt ₅	v	02h ₇					

SIGN – Sign (Compare to Zero)

Synopsis

Take sign of value. This is an extended Mnemonic for the [CMP](#) instruction.

Description

The sign of a register is placed in the target register Rt.

Instruction Format: RI

Integer:

35	29	2827	2625	24	20	19	18	14	13	12	8	7	6	0
2Ah ₇	~ ₂	2 ₂	0 ₅	Ta	Ra ₅	Tt	Rt ₅	v	02h ₇					

Float:

10h ₇	~ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v	35h ₇					

Operation:

$$Rt = Ra < 0 ? -1 : Ra = 0 ? 0 : 1$$

Vector Operation

for x = 0 to VL - 1

$$\text{if } (Vm[x]) \text{ } Vt[x] = Va[x] < 0 ? -1 : Va[x]=0 ? 0 : 1$$

SLL –Shift Left Logical

Description:

Left shift an operand value by an operand value and place the result in the target register. Zeros are shifted into the least significant bits. The first operand must be in a register specified by the Ra. The second operand may be either a register specified by the Rb field of the instruction, or an immediate value.

Instruction Formats: R2

35	29	2827	2625	24	20	19	18	14	13	12	8	7	6	0
19h ₇	~ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v	02h ₇					

Vector Mask Instruction Format: R2 (MSLL)

1 clock cycle

Operation Size: .o

Execution Units: integer ALU

Exceptions: none

Example:

SLLP –Shift Left Logical Pair

Description:

Left shift a pair of operand values by an operand value and place the result in the target register. The upper 64 bits of the result are placed in the target register. Zeros are shifted into the least significant bits. The operand pair must be in registers specified by the Ra and Rc field of the instruction. The third operand may be either a register specified by the Rb field of the instruction, or an immediate value.

This instruction may also be used to perform a left rotate of a single register by specifying the same register for Ra and Rc.

Instruction Formats: R3

Operation Size: .o

Execution Units: integer ALU

Exceptions: none

Example:

SLT – Set if Less Than

Description:

The set instruction places a 1 or 0 in the target register based on the relationship between the two source operands. If operand Ra is less than a second operand in either a register (Rb) or a constant supplied in the instruction, then the target register is set to a one, otherwise the target register is set to a zero. The operands are treated as signed values.

The register form of the instruction may also be used to test for greater than by swapping the operands around.

Instruction Format: RI

35	20	19	18	14	13	12	8	7	6	0
Constant ₁₆	Ta	Ra ₅	Tt	Rt ₅	v	28h ₇

SLE – Set if Less Than or Equal

Description:

The set instruction places a 1 or 0 in the target register based on the relationship between the two source operands. If operand Ra is less than or equal to a second operand in register (Rb) then the target register is set to a one, otherwise the target register is set to a zero. The operands are treated as signed values.

There is no immediate form to this instruction. An immediate equivalent may be achieved using the [SLT](#) instruction and adjusting the constant by one.

Instruction Format: R2

Integer:

The integer register form of instruction is an alternate mnemonic for [SGE](#) where the operands have been swapped.

35	29	2827	2625	24	20	19	18	14	13	12	8	7	6	0

13h ₇	~ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v						31h ₇

SLEU – Set if Less Than or Equal

Description:

The set instruction places a 1 or 0 in the target register based on the relationship between the two source operands. If operand Ra is less than or equal to a second operand in register (Rb) then the target register is set to a one, otherwise the target register is set to a zero. The operands are treated as unsigned values.

This instruction is an alternate mnemonic for the SGEU instruction where the operands have been swapped.

There is no immediate form to this instruction. An immediate equivalent may be achieved using the SLTU instruction and adjusting the constant by one.

Instruction Format: R2

35	29	2827	2625	24	20	19	18	14	13	12	8	7	6	0
2Fh ₇	~ ₂	Ta ₂	Ra ₅	Tb	Rb ₅	Tt	Rt ₅	v	02h ₇					

The set instruction places a 1 or 0 in the target register based on the relationship between the two source operands. If operand Ra is less than a second operand in either a register (Rb) or a constant supplied in the instruction, then the target register is set to a one, otherwise the target register is set to a zero. The operands are treated as unsigned values.

Instruction Format: RI

2Eh ₇	~ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v	02h ₇					

SNE – Set if Not Equal

Description:

The set instruction places a 1 or 0 in the target register based on the relationship between the two source operands. If operand Ra is not equal to a second operand in register (Rb) or an immediate constant then the target register is set to a one, otherwise the target register is set to a zero.

For floating-point operations positive and negative zero are considered equal.

SRA –Shift Right Arithmetic Pair

Description:

This is an alternate mnemonic for the signed field extract [EXT](#) instruction.

Right shift a pair of operand values by an operand value and place the result in the target register. The lower 64 bits of the result are placed in the target register. The sign bit is shifted into the most significant bits. The operand pair must be in registers specified by the Ra and Rb field of the instruction. The third operand may be either a register specified by the Rc field of the instruction, or an immediate value.

Instruction Format: R4

Instruction Format: R4

Clock Cycles: 1

Execution Units: Integer ALU

Exceptions: none

Notes:

U21NDX – UTF21 Index

Description:

This instruction searches Ra, which is treated as an array of three UTF21 values, for a value specified by Rb and places the index of the value into the target register Rt. If the UTF21 value is not found -1 is placed in the target register. A common use would be to search for a null. The index result may vary from -1 to +2. The index of the first found value is returned (closest to zero).

Integer Instruction Format: RI

The RI instruction format may be used with an immediate extension word for full 21-bit constants.

Notes:

Graphics

Co-ordinates

Co-ordinates are specified as 16.16 fixed point numbers. x, y, z co-ordinates occupy bits 0 to 31, 32 to 63, and 64 to 95 respectively of a register.

127	96	95	64	63	32	31	0
~		z coord		y coord		x coord	

Colors

Colors are represented using RGB888 format. Colors are placed in the low order 24-bits of a register.

127	32	31	24	23	16	15	8	7	0
~		Z-order		Blue		Green		Red	

BLEND – Blend Colors

Description:

This instruction blends two colors whose values are in Ra and Rb according to an alpha value in Rc. The resulting color is placed in register Rt. The alpha value is an eight-bit value assumed to be a binary fraction less than one. The color values in Ra and Rb are assumed to be RGB888 format colors. The result is a RGB888 format color. The high order eight bits of the result register are set to the high order eight bits of Ra. Note that a close approximation to $1.0 - \alpha$ is used. Each component of the color is blended independently.

Instruction Format: R3

35	31	30	28	27	26	25	24	20	19	18	14	13	12	11	9	8	7	0

30h ₇	~ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v	03h ₇					

Operation:

$$Rt.R = (Ra.R * \alpha) + (Rb.R * \sim\alpha)$$

$$Rt.G = (Ra.G * \alpha) + (Rb.G * \sim\alpha)$$

$$Rt.B = (Ra.B * \alpha) + (Rb.B * \sim\alpha)$$

Clock Cycles: 2

CLIP – Clip Point

Description:

The clip instruction checks that the point in Ra is within the graphics target area always and clip region if enabled. The target and clip areas must have been previously set. If the point should be clipped a one is set in Rt, otherwise Rt is set to zero.

Points are represented in 16.16 fixed-point format.

PLOT – Plot Point

Description:

This instruction plots a point in the graphics target area. The point’s co-ordinates are in Ra, the color to use is in Rb.

35	29	2827	2625	24 20	19	18 14	13	12 8	7	6	0
34h7		~2	Tb2	Rb5	Ta	Ra5	Tt	Rt5	v		02h7

TRANSFORM – Transform Point

Description:

The point transform instruction transforms a point from one location to another using a transform function. The transform function has 12 co-efficients in the form of a matrix to used in the calculation.

Points are represented in 16.16 fixed-point format.

35	29	28 24	23 21	20	19	18 14	13	12 8	7	6	0
11h ₇	~ ₅	m ₃	z	Ta	Ra ₅	Tt	Rt ₅	v	01h ₇		

Clock Cycles: 2

RW_COEFF – Read/Write Co-efficient

Description:

RW_COEFF reads and writes a coefficient value to be used for the transform matrix. Ra contains the number of the coefficient to read or write. Rb contains the new value for the coefficient. Coefficients are in 16.16 fixed point format.

Instruction Format: R2

Memory Operations

CACHE – Cache Command

CACHE Cmd, d[Rn]

Description:

This instruction commands the cache controller to perform an operation. Commands are summarized in the command table below. Commands may be issued to both the instruction and data cache at the same time. The address of the cache line to be invalidated is passed in Ra if needed.

Instruction Formats: CACHE

35 32	31 20	19	18 14	13	12 10	9 8	7	0
15 _{3..0}	Const ₁₂	Ta	Ra ₅	0	DC ₃	IC ₂	60h ₈	

Commands:

IC ₂	Mne.	Operation
0	NOP	no operation
1	inline	invalidate line associated with given address
2	invall	invalidate the entire cache (address is ignored)
3		reserved

DC ₃	Mne.	Operation
0	NOP	no operation
1	enable	enable cache (instruction cache is always enabled)
2	disable	not valid for the instruction cache
3	inline	invalidate line associated with given address
4	invall	invalidate the entire cache (address is ignored)
5 to 7		reserved

Notes:

LDx – Load

Description:

Load a value from memory into a register.

Formats Supported:

Register Indirect with Displacement

This mode may make use of immediate prefixes to extend the range.

35	32	31	20	19	18	14	13	12	8	7	0
Func _{3..0}	Const ₁₂	Ta	Ra ₅	Tt	Rt ₅	60h ₈					

Scalar Indexed Form (LD)

The effective address (EA) is calculated as the sum of Ra plus Rb multiplied by a scale.

35	32	31	30	29	27	26	25	24	20	19	18	14	13	12	8	7	0

Func _{3..0}	Const ₁₂	Ta	Ra ₅	Tt	Rt ₅	E2h ₈					

Data is loaded from memory addresses separated by the stride amount specified by register field Rc, beginning with the sum of Ra and an immediate value. If the vector mask bit is clear and the

‘z’ bit is set in the instruction then the corresponding element of the vector register is loaded with zero. If the vector mask bit is clear and the ‘z’ bit is clear in the instruction then the corresponding element of the vector register is left unchanged (no value is loaded from memory).

Elements are loaded only up to the length specified in the vector length register.

Vm[x]	z	Result
0	0	Vt[x] = Vt[x] (unchanged)
0	1	Vt[x] = 0 (set to zero)
1	0	Vt[x] = memory, sign extended

Func _{3..0}	Const ₁₂			Ta	Ra ₅		Tt	Rt ₅		E3h ₈	

Operation:

```
n = 0
for x = 0 to vector length
  if (Vm[x])
    Vt[x] = Memory[d + Ra + Vb[x]]
  else
    Vt[x] = z ? 0 : Vt[x]
```

Exceptions: none

LDB – Load Byte (8 bits)

Description:

Data is loaded from the memory address which is the sum of an immediate value and the sum of Ra and Rb times a scale. The value loaded is sign extended from bit 7 to the machine width.

Formats Supported: LD

Operation:

$$Rt = \text{Memory}_8[d + Ra]$$

OR

$$Rt = \text{Memory}_8[Ra + Rb * Sc]$$

Exceptions: none

LDBZ – Load Byte, Zero Extend (8 bits)

Description:

Data is loaded from the memory address which is the sum of an immediate value and the sum of Ra and Rb times a scale. The value loaded is zero extended from bit 8 to the machine width.

Formats Supported: LD

Operation:

$$Rt = \text{Memory}_8[d + Ra]$$

OR

$$Rt = \text{Memory}_8[Ra + Rb * Sc]$$

Exceptions: none

LDO – Load Octa (64 bits)

Description:

Data is loaded into Rt from the memory address which is the sum of an immediate value and the sum of Ra and Rb scaled.

Formats Supported: RR,RI

Operation:

$R_t = \text{Memory}_{64}[d + R_a]$

OR

$R_t = \text{Memory}_{64}[R_a + R_b * S_c]$

Execution Units: Mem

Exceptions: none

LDT – Load Tetra (32 bits)

Description:

Data is loaded from the memory address which is the sum of Ra and an immediate value or the sum of Ra and Rb scaled. The value loaded is sign extended from bit 31 to the machine width.

Formats Supported: RR,RI

Operation:

$$Rt = \text{Memory}_{32}[d + Ra]$$

OR

$$Rt = \text{Memory}_{32}[Ra + Rb * Sc]$$

Execution Units: Mem

Exceptions: none

LDTZ – Load Tetra, Zero Extend (32 bits)

Description:

Data is loaded from the memory address which is the sum of Ra and an immediate value or the sum of Ra and Rb scaled. The value loaded is zero extended from bit 8 to the machine width.

Formats Supported: RR,RI

Operation:

$$Rt = \text{Memory}_{32}[d + Ra]$$

OR

$$Rt = \text{Memory}_{32}[Ra + Rb * Sc]$$

Execution Units: Mem

Exceptions: none

LDW – Load Wyde (16 bits)

Description:

Data is loaded from the memory address which is the sum of Ra and an immediate value or the sum of Ra and Rb scaled. The value loaded is sign extended from bit 15 to the machine width.

Formats Supported: LD

Operation:

$$Rt = \text{Memory}_{16}[d + Ra]$$

OR

$$Rt = \text{Memory}_{16}[Ra + Rb * Sc]$$

Execution Units: Mem

Exceptions: none

LDWZ – Load Wyde, Zero Extend (16 bits)

Description:

Data is loaded from the memory address which is the sum of Ra and an immediate value or the sum of Ra and Rb scaled. The value loaded is zero extended from bit 16 to the machine width.

Formats Supported: LD

Operation:

$$Rt = \text{Memory}_{16}[d + Ra]$$

OR

$$Rt = \text{Memory}_{16}[Ra + Rb * Sc]$$

Execution Units: Mem

Exceptions: none

LEA – Load Effective Address

Description:

This instruction computes the effective address for a load/store operation. The data type tag for the target register is set to indicate it contains a pointer.

Formats Supported:

STB – Store Byte (8 bits)

Description:

This instruction stores a byte (8 bit) value to memory.

Instruction Format: ST

Register Indirect Operation:

$$\text{Memory}_8[\text{d} + \text{Ra}] = \text{Rb}$$

Indexed Operation:

$$\text{Memory}_8[\text{Ra} + \text{Rc} * \text{Sc}] = \text{Rb}$$

STBZ – Store Byte and Zero (8 bits)

Description:

This instruction stores a byte (8 bit) value to memory. After the byte is stored to memory the register is zeroed out.

Instruction Format: ST

Register Indirect Operation:

$$\begin{aligned}\text{Memory}_8[\text{d} + \text{Ra}] &= \text{Rb} \\ \text{Rb} &= 0\end{aligned}$$

Indexed Operation:

$$\begin{aligned}\text{Memory}_8[\text{Ra} + \text{Rc} * \text{Sc}] &= \text{Rb} \\ \text{Rb} &= 0\end{aligned}$$

STO – Store Octa (64 bits)

Description:

This instruction stores an octa-byte (64 bit) value to memory. The memory address is calculated as the sum of an immediate constant and the sum of Ra and Rb scaled.

Instruction Format: ST

Operation:

$$\text{Memory}_{64}[\text{d} + \text{Ra} + \text{Rb} * \text{Sc}] = \text{Rs}$$

STOZ – Store Octa and Zero (64 bits)

Description:

This instruction stores an octa-byte (64 bit) value to memory. The memory address is calculated as the sum of an immediate constant and the sum of Ra and Rb scaled. After the octa is stored to memory the register is zeroed out.

Instruction Format: ST

Operation:

$$\text{Memory}_{64}[\text{d} + \text{Ra} + \text{Rb} * \text{Sc}] = \text{Rs}$$

$$\text{Rs} = 0$$

STPTR – Store Pointer (64 bits)

Description:

This instruction stores an octa-byte (64 bit) value to memory. The memory address is calculated as the sum of an immediate constant and the sum of Ra and Rb scaled. STPTR begins a series of stores to memory addresses scaled by eight bits, until the address zero is reached. The first store proceeds normally, for the second and subsequent stores a byte store operation takes place with the value zero being to memory.

The purpose of the STPTR instruction is to allow a code dense implementation of a write barrier that indicates where in memory a pointer is stored with increasing resolution.

This instruction assumes that card memory used to record pointer locations is located at the low end of the memory system.

Instruction Format: ST

Operation:

```

ea = d + Ra + Rb*Sc
Memory64[ea] = Rs
while ea <> 0
    ea = ea >> 8
    Memory8[ea] = 0
  
```

STT – Store Tetra (32 bits)

Description:

This instruction stores a tetra-byte (32 bit) value to memory. The memory address is calculated as the sum of an immediate constant and the sum of Ra and Rb scaled.

Instruction Format: ST

Operation:

$$\text{Memory}_{32}[\text{d} + \text{Ra} + \text{Rb} * \text{Sc}] = \text{Rs}$$

STTZ – Store Tetra and Zero (32 bits)

Description:

This instruction stores a tetra-byte (32 bit) value to memory. The memory address is calculated as the sum of an immediate constant and the sum of Ra and Rb scaled. After the tetra is stored to memory the register is zeroed out.

Instruction Format: ST

Operation:

$$\text{Memory}_{32}[\text{d} + \text{Ra} + \text{Rb} * \text{Sc}] = \text{Rs}$$

$$\text{Rs} = 0$$

STW – Store Wyde (16 bits)

Description:

This instruction stores a byte (16 bit) value to memory. The memory address is calculated as the sum of an immediate constant and the sum of Ra and Rb scaled.

Instruction Format: ST

Operation:

$$\text{Memory}_{16}[\text{d} + \text{Ra} + \text{Rb} * \text{Sc}] = \text{Rs}$$

STWZ – Store Wyde and Zero (16 bits)

Description:

This instruction stores a byte (16 bit) value to memory. The memory address is calculated as the sum of an immediate constant and the sum of Ra and Rb scaled. After the wyde is stored to memory the register is zeroed out.

Instruction Format: ST

Operation:

$$\text{Memory}_{16}[\text{d} + \text{Ra} + \text{Rb} * \text{Sc}] = \text{Rs}$$

$$\text{Rs} = 0$$

Flow Control (Branch Unit) Operations

Branches

Displacement

The conditional branch displacement is in nybbles since code may be nybble aligned. The branch displacement is 16 bits for a range of $\pm 16\text{KB}$. This may be extended to 35 bits or $\pm 8\text{GB}$ with a branch modifier.

The displacement for the branch-and-link instruction is the number of nybbles to the target address from the current one. This allows subroutines to be aligned at any nybble address.

Modifier

The branch modifier may be used to make it possible to branch to a target address contained in a register, and to store the return address in a register. Simultaneously the branch displacement is increased to 35 bits allowing a $\pm 8\text{GB}$ branch range.

BAL – Branch and Link

Description:

This instruction may be used to call a subroutine using relative addressing. The address of the instruction after the BAL is stored in the specified return address register (R_t) then a jump to the address specified in the instruction is made. The address range is 26 bits or $\pm 16\text{MB}$.

The return address register is assumed to be $x1$ if not otherwise specified. The BAL instruction does not require space in branch predictor tables.

Formats Supported: BAL

35	10	9 8	7 0
Constant ₂₆	R_{t2}	41h ₈	

Flags Affected: none

Operation:

$$R_t = IP + 9$$

$$IP = IP + \text{displacement}$$

Execution Units: Branch

Exceptions: none

Notes:

BBS – Branch if Bit Set

Description:

This instruction branches to the target address if the bit number identified by the Rb specifier in the instruction is set in Ra. Rb may be a value in a register or a six-bit unsigned immediate value. Otherwise, program execution continues with the next instruction. With a branch modifier instruction, the target address is formed as the sum of Rc and a displacement. If Rc is x31 then the instruction pointer value is used. Otherwise, the target address is the sum of the instruction pointer value and the displacement specified in the instruction.

Formats Supported: BR

35	27	26	25	24	20	19	18	14	13	8	7	6	0
Const ₉	Tb ₂	Rb ₅	C	Ra ₅	Const ₆	0	4Dh ₈						

Operation:

If (Ra[Rb])

IP = IP + Displacement16

With Modifier

Rt = IP + 9

If (Ra[Rb])

IP = Rc + Displacement35

Execution Units: Branch

Exceptions: none

Notes:

BEQ – Branch if Equal

Description:

This instruction branches to the target address if the contents of Ra and Rb are equal, otherwise program execution continues with the next instruction. With a branch modifier instruction, the target address is formed as the sum of Rc and a displacement. If Rc is x31 then the instruction pointer value is used. Otherwise, the target address is the sum of the instruction pointer value and the displacement specified in the instruction.

Formats Supported: BR

35	27	26	25	24	20	19	18	14	13	8	7	6	0
Const ₉	Tb ₂	Rb ₅	C	Ra ₅	Const ₆	0	4Eh ₈						

Operation:

If (Ra = Rb)

IP = IP + Displacement16

With Modifier

Rt = IP + 9

If (Ra = Rb)

IP = Rc + Displacement35

Execution Units: Branch

Exceptions: none

Notes:

For a floating-point comparison positive and negative zero are considered equal.

BGE – Branch if Greater Than or Equal

Description:

This instruction branches to the target address if the contents of Ra is greater than or equal to Rb, otherwise program execution continues with the next instruction. The values in Ra and Rb are treated as signed values.

Formats Supported: BR

35	27	26	25	24	20	19	18	14	13	8	7	6	0
Const ₉	Tb ₂	Rb ₅	C	Ra ₅	Const ₆	0	49h ₈						

Operation:

If (Ra >= Rb)

IP = IP + Displacement

Execution Units: Branch

Exceptions: none

BGEU – Branch if Greater Than or Equal Unsigned

Description:

This instruction branches to the target address if the contents of Ra is greater than or equal to Rb, otherwise program execution continues with the next instruction. The values in Ra and Rb are treated as unsigned values. The target address is formed as the sum of Rc and a displacement. If Rc is x31 then the program counter value is used.

Formats Supported: BR

35	27	26	25	24	20	19	18	14	13	8	7	6	0
Const ₉	Tb ₂	Rb ₅	C	Ra ₅	Const ₆	0	4Bh ₈						

Operation:

$$Rt = IP + 8$$

If (Ra >= Rb)

$$PC = Rc + \text{Displacement}$$

Execution Units: Branch

Exceptions: none

BGT – Branch if Greater Than

Description:

This instruction is an alternate mnemonic for the [BLT](#) instruction where the register operands have been swapped.

This instruction branches to the target address if the contents of Ra is less than Rb, otherwise program execution continues with the next instruction. The values in Ra and Rb are treated as signed values. The target address is formed as the sum of Rc and a displacement. If Rc is x31 then the program counter value is used.

Formats Supported: BR

35	27	26	25	24	20	19	18	14	13	8	7	6	0
Const ₉	Tb ₂	Rb ₅	C	Ra ₅	Const ₆	0	48h ₈						

Operation:

If (Ra < Rb)

$$PC = Rc + \text{Displacement}$$

Execution Units: Branch

Exceptions: none

BGTU – Branch if Greater Than Unsigned

Description:

This instruction is an alternate mnemonic for the [BLTU](#) instruction where the register operands have been swapped.

This instruction branches to the target address if the contents of Ra is less than Rb, otherwise program execution continues with the next instruction. The values in Ra and Rb are treated as unsigned values. The target address is formed as the sum of Rc and a displacement. If Rc is x31 then the program counter value is used.

Formats Supported: BR

35	27	26	25	24	20	19	18	14	13	8	7	6	0
Const ₉	Tb ₂	Rb ₅	C	Ra ₅	Const ₆	0	4A ₈						

Operation:

$$Rt = IP + 8$$

If (Ra < Rb)

$$PC = Rc + \text{Displacement}$$

Execution Units: Branch

Exceptions: none

BNE – Branch if Not Equal

Description:

This instruction branches to the target address if the contents of Ra and Rb are not equal, otherwise program execution continues with the next instruction.

Formats Supported: BR

35	27	26	25	24	20	19	18	14	13	8	7	6	0
Const ₉	Tb ₂	Rb ₅	C	Ra ₅	Const ₆	0	4Fh ₈						

Operation:

If (Ra \neq Rb)

IP = IP + Displacement

Execution Units: Branch

Exceptions: none

BLE – Branch if Less Than or Equal

Description:

This is an alternate mnemonic for the [BGE](#) instruction, where the register operands have been swapped.

This instruction branches to the target address if the contents of Ra is greater than or equal to Rb, otherwise program execution continues with the next instruction. The values in Ra and Rb are treated as signed values.

Formats Supported: BR

35	27	26	25	24	20	19	18	14	13	8	7	6	0
Const ₉	Ta ₂	Ra ₅	C	Rb ₅	Const ₆	0	49h ₈						

Operation:

If (Ra >= Rb)

PC = Rc + Displacement

Execution Units: Branch

Exceptions: none

BLEU – Branch if Less Than or Equal Unsigned

Description:

This is an alternate mnemonic for the [BGEU](#) instruction, where the register operands have been swapped.

This instruction branches to the target address if the contents of Ra is greater than or equal to Rb, otherwise program execution continues with the next instruction. The values in Ra and Rb are treated as unsigned values.

Formats Supported: BR

35	27	26	25	24	20	19	18	14	13	8	7	6	0
Const ₉	Ta ₂	Ra ₅	C	Rb ₅	Const ₆	0	4Bh ₈						

Operation:

If (Ra >= Rb)

IP = IP + Displacement

Execution Units: Branch

Exceptions: none

BLT – Branch if Less Than

Description:

This instruction branches to the target address if the contents of Ra is less than Rb, otherwise program execution continues with the next instruction. The values in Ra and Rb are treated as signed values.

Formats Supported: BR

35	27	26	25	24	20	19	18	14	13	8	7	6	0
Const ₉	Tb ₂	Rb ₅	C	Ra ₅	Const ₆	0	48h ₈						

Operation:

If (Ra < Rb)

IP = IP + Displacement

Execution Units: Branch

Exceptions: none

BLTU – Branch if Less Than Unsigned

Description:

This instruction branches to the target address if the contents of Ra is less than Rb, otherwise program execution continues with the next instruction. The values in Ra and Rb are treated as unsigned values.

Formats Supported: BR

35	27	26	25	24	20	19	18	14	13	8	7	6	0

Operation:

if (Ra < Rb)
 IP = IP + Displacement

Execution Units: Branch

Exceptions: none

BRA – Unconditional Branch

Description:

This instruction is an alternate mnemonic for the [BAL](#) instruction. The address range is 26 bits or $\pm 16\text{MB}$.

Formats Supported: JAL

35	10	9	8	7	0
Constant ₂₆		0 ₂		41h ₈	

Flags Affected: none

Operation:

$\text{IP} = \text{IP} + \text{Displacement}$

Execution Units: Branch

Exceptions: none

Notes:

BSR – Unconditional Branch to Subroutine

Description:

This instruction is an alternate mnemonic for the [BAL](#) instruction. The address range is 26 bits or $\pm 16\text{MB}$.

Formats Supported: JAL

35	10	9	8	7	0
Constant ₂₆		1 ₂		41h ₈	

Flags Affected: none

Operation:

$\text{Rt} = \text{IP} + 9$

$\text{IP} = \text{IP} + \text{Displacement}$

Execution Units: Branch

Exceptions: none

Notes:

CALL – Call Subroutine

Description:

This instruction changes program flow to the target address specified and stores the return address on the stack. The target address may be either an absolute address or an instruction pointer relative address. The ‘A’ bit of the instruction selects absolute addressing if set.

Formats Supported: CALL

35	10	9	8	7	0
Constant ₂₆		0	A	7Ch ₈	

Flags Affected: none

Operation:

$SP = SP - 8$

$Memory[SP] = IP + 9$

If (A)

$IP = \text{constant}$

else

$IP = IP + \text{constant}$

Execution Units: Branch

Exceptions: none

Notes:

CHK – Check Register Against Bounds

Description:

A register is compared to two values. If the register is outside of the bounds then an exception will occur.

Instruction Format: RI

35 ~ ₅	31 Rm ₃	30 28 Tc	27 Td ₂	26 25 Rd ₆	24 20 Tc	19 Rc ₅	18 14 A	13 12 m ₃	11 9 z	8 58h ₈	7 0
----------------------	-----------------------	-------------	-----------------------	--------------------------	-------------	-----------------------	------------	-------------------------	-----------	-----------------------	--------

35 Constant ₁₆	20 Ta	19 Ra ₅	18 14 0 ₄	13 10 Cn ₂	9 8 v	7 22h ₇	6 0
------------------------------	----------	-----------------------	-------------------------	--------------------------	----------	-----------------------	--------

Cn ₂	Interpretation
0	Ra <= Rc <= Constant
1	Ra < Rc <= Constant
2	Ra <= Rc < Constant
3	Ra < Rc < Constant

Instruction Format: R3

35 ~ ₅	31 Rm ₃	30 28 Tc	27 Td ₂	26 25 Rd ₆	24 20 Tc	19 Rc ₅	18 14 A	13 12 m ₃	11 9 z	8 58h ₈	7 0
----------------------	-----------------------	-------------	-----------------------	--------------------------	-------------	-----------------------	------------	-------------------------	-----------	-----------------------	--------

35 22h ₇	29 ~ ₂	28 27 Tb ₂	26 25 Rb ₅	24 20 Ta	19 Ra ₅	18 14 0 ₄	13 10 Cn ₂	9 8 v	7 03h ₇	6 0
------------------------	----------------------	--------------------------	--------------------------	-------------	-----------------------	-------------------------	--------------------------	----------	-----------------------	--------

Cn ₂	Interpretation
0	Ra <= Rb <= Rc
1	Ra < Rb <= Rc
2	Ra <= Rb < Rc
3	Ra < Rb < Rc

Supported Formats: .o

Clock Cycles: 2

Execution Units: Integer ALU, Float, Decimal Float, Posit

Exceptions: bounds check

Notes:

The system exception handler will typically transfer processing back to a local exception handler.

JAL – Jump and Link

Description:

This instruction may be used to both call a subroutine and return from it. The address of the instruction after the JAL is stored in the specified return address register (Rt) then a jump to the address specified in the instruction is made. The address range is 26 bits or 16MB.

The return address register is assumed to be x1 if not otherwise specified. The JAL instruction does not require space in branch predictor tables.

Formats Supported: JAL

35	10	9	8	7	0
Constant ₂₆			Rt ₂	40h ₈	

Flags Affected: none

Operation:

$$Rt = IP + 9$$

$$IP = \text{displacement}$$

Execution Units: Branch

Exceptions: none

Notes:

JALR – Jump and Link to Register

Description:

This instruction may be used to both call a subroutine and return from it. The address of the next instruction is stored in the specified return address register (Rt) then a jump to the address specified in the instruction plus an index register value is made.

The return address register is assumed to be x1 if not otherwise specified. The JALR instruction does not require space in branch predictor tables.

If x31 is specified for Ra then the current instruction pointer value is used.

Formats Supported: JALR

35	20	19	18	14	13	12	8	7	0
Constant ₁₆	Ta	Ra ₅	0	Rt ₅	42h ₈				

Flags Affected: none

Operation:

$Rt = IP + 9$

If Ra=31

$IP = IP + \text{displacement}$

Else

$IP = Ra + \text{Displacement}$

Execution Units: Branch

Exceptions: none

Notes:

JMP – Jump

Description:

This instruction is an alternate mnemonic for the [JAL](#) instruction. It may be used to jump directly to a specific address. The address range is 26 bits or 16MB.

The return address register is assumed to be x0 (discarding the return address). The JMP instruction does not require space in branch predictor tables.

Formats Supported: JAL

35	10	9	8	7	0
Constant ₂₆			0 ₂	40h ₈	

Flags Affected: none

Operation:

IP = displacement

Execution Units: Branch

Exceptions: none

Notes:

RET – Return from Subroutine

Description:

This instruction returns from a subroutine by transferring program execution to the address popped off the stack. A constant is added to the stack pointer. The assembler assumes a constant of eight if not specified.

Formats Supported: RET

35	20	19	18 14	13	12 8	7	0
Constant ₁₆	0 ₁	30 ₅	0 ₁	30 ₅	7B ₈		

Flags Affected: none

Operation:

Execution Units: Branch, Memory

Exceptions: an unimplemented instruction exception may occur if a vector register is specified.

Notes:

Return address prediction hardware may make use of the RET instruction.

Macro Operations

ENTER – Enter Routine

Description:

This instruction is used for subroutine linkage at entrance into a subroutine. First it pushes the frame pointer and return address onto the stack, next the stack pointer is loaded into the frame pointer, and finally the stack space is allocated. This instruction is code dense, replacing four other instructions with a single instruction for a commonly used operation.

A maximum of 64kB may be allocated on the stack. An immediate prefix may not be used with this instruction. Registers used for both the return address and stack pointer may be specified. The ABI recommends using x30 for the stack pointer and x1 for the return address. The frame pointer is assumed to be x29.

Note that the constant must be a negative number at least equal to -32 and a multiple of eight.

Note that the instruction reserves room for two words in addition to the return address and frame pointer. One use for the extra words may to store exception handling information.

Integer Instruction Format: RI

35	20	19	18	14	13	12	8	7	6	0
Constant ₁₆	0	Ra ₅	0	Sp ₅	0	3Ch ₇				

Operation:

Memory-8[SP] = FP

Memory[SP] = RA

FP = SP - 32

SP = SP + constant

LEAVE – Leave Routine

Description:

This instruction is used for subroutine linkage at exit from a subroutine. First it moves the frame pointer to the stack pointer deallocating any stack memory allocations. Next the frame pointer and return address are popped off the stack. The stack pointer is adjusted by the amount specified in the instruction. Then a jump is made to the return address. This instruction is code dense, replacing five other instructions with a single instruction for a commonly used operation.

The ABI recommends using x30 for the stack pointer and x1 for the return address. The frame pointer is assumed to be x29.

Instruction Format: POP

35 32 21	20	19	18 14	13	12 8	7	6	0
5 ₄	Adjustment ₁₂	0	Ra ₅	0	Sp ₅	0	67h ₇	

Operation:

SP = FP

FP = Memory-8[SP]

RA = Memory[SP]

SP = SP + Adjustment * 8

IP = RA

POP – Pop Register from Stack

Description:

This instruction pops a register from a stack.

Instruction Format: POP

35 32	31 27	26 25	24 20	19	18 14	13	12 8	7	6	0
1 ₄	~ ₅	0 ₂	0 ₅	0	Ra ₅	0	Sp ₅	v	67h ₇	

Operation:

Ra = Memory[SP]

SP = SP + 8

POP – Pop Register Pair from Stack

Description:

This instruction pops a pair of registers from a stack.

Instruction Format: POP Pair

35 32	31 27	26 25	24 20	19	18 14	13	12 8	7	6	0
2 ₄	~ ₅	0 ₂	Rb ₅	0	Ra ₅	0	Sp ₅	v	67h ₇	

Operation:

Rb = Memory[SP]

Ra = Memory[SP+8]

SP = SP + 16

PUSH – Push Register on Stack

Description:

This instruction pushes a register onto a stack.

Instruction Format: PUSH

35 32	31 27	26 25	24 20	19	18 14	13	12 8	7	6	0
1 ₄	~ ₅	0 ₂	0 ₅	0	Ra ₅	0	Sp ₅	v	6Fh ₇	

Operation:

$$SP = SP - 8$$

$$\text{Memory}[SP] = Ra$$

PUSH – Push Register Pair on Stack

Description:

This instruction pushes a register onto a stack.

Instruction Format: PUSH Pair

35 32	31 27	26 25	24 20	19	18 14	13	12 8	7	6	0
2 ₄	~ ₅	0 ₂	Rb ₅	0	Ra ₅	0	Sp ₅	v	6Fh ₇	

Operation:

$$SP = SP - 16$$

$$\text{Memory}[SP] = Rb$$

$$\text{Memory}[SP+8] = Ra$$

RTS – Return using Stack

Description:

This instruction is used to return from a subroutine. The link register is popped off the stack and loaded into the IP. The stack pointer is adjusted by an amount given in the instruction. The amount includes space for the link register, so should always be at least eight. The adjustment field is shifted left three times before use. Up to 32752 bytes of parameters may be popped off the stack.

The ABI recommends using x30 for the stack pointer and x1 for the return address.

Instruction Format: POP

35 32	31	20	19	18 14	13	12 8	7	6	0
4 ₄	Adjustment ₁₂	0	Ra ₅	0	Sp ₅	v	67h ₇		

Operation:

Ra = Memory[SP]

SP = SP + Adjustment

IP = Ra

UNLINK – Unlink Stack

Description:

This instruction is used for subroutine linkage at exit from a subroutine. First it moves the frame pointer to the stack pointer deallocating any stack memory allocations. Next the frame pointer is popped off the stack. This instruction is code dense, replacing three other instructions with a single instruction for a commonly used operation.

The ABI recommends using x30 for the stack pointer and x29 for the frame pointer.

Instruction Format: POP

35 32 21	20	19	18 14	13	12 8	7	6	0
4 ₄	Ajustment ₁₂	0	Ra ₅	0	Sp ₅	0	67h ₇	

Operation:

SP = FP

FP = Memory[SP]

SP = SP + 8

System Instructions

BASE – Set Base Register

Description:

This instruction associates a base register in Rb with an address stored in a register Ra. The upper nybble of the address is set to indicate which base register to use. Which bits are set depends on how many bits are in use to address memory. Bits in use to represent memory addresses will be 32, 48, or 64. Making the top four bits bits 28 to 31, 44 to 47 or 60 to 63. Bits beyond the configured memory range will be set to zero.

Instruction Format:

35	29	2827	2625	24	20	19	18	14	13	12	8	7	6	0
26h ₇	f ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v	07h ₇					

f: 0=apply only in user mode, 2 = apply in any mode

Operation:

if (f = 2 or user mode)

$Ra[63:amsb] = \{0, Rb[3:0]\}$

Execution Units: ALU

Clock Cycles:

Exceptions: none

Notes:

BRK – Break

Description:

This instruction initiates the processor debug routine. The processor enters debug mode. The cause code register is set to the value specified in the instruction. Interrupts are disabled. The instruction pointer is reset to the contents of tvec[4] and instructions begin executing. There should be a jump instruction placed at the break vector location. The address of the BRK instruction is stored in the EIP register.

Instruction Format: BRK

35	22	21	14	13	12	8	7	0
~14	Cause ₈	0	0 ₅	00h ₈				

Operation:

PMSTACK = (PMSTACK << 4) | 10

CAUSE = Const₈

EIP = IP

IP = tvec[4]

Execution Units: Branch

Clock Cycles:

Exceptions: none

Notes:

CSRx – Control and Special / Status Access

Description:

The CSR instruction group provides access to control and special or status registers in the core. For the read operation the current value of the CSR is placed in the target register Rt.

Instruction Format: CSR

35	20	19	18	14	13	12	8	7	6	0
Regno ₁₆	O		Ra ₅	O		Rt ₅	v		0Fh ₇	

OO		Operation
0	CSRRD	Only read the CSR, no update takes place, Ra should be x0.
1	CSRRW	Read/Write to CSR
2	CSRRS	Read/Set CSR bits
3	CSRRC	Read/Clear CSR bits

CSRRS and CSRRC operations are only valid on registers that support the capability.

The Regno_[15..12] field is reserved to specify the operating mode. Note that registers cannot be accessed by a lower operating mode.

Execution Units: Integer, the instruction may be available on only a single execution unit (not supported on all available integer units).

Clock Cycles: 1

Exceptions: privilege violation attempting to access registers outside of those allowed for the operating mode.

EXEC – Execute Instruction

Description:

This instruction executes an instruction in a register. The instruction is contained in register Ra. EXEC may take several additional clock cycles to complete depending on the instruction. Note that the EXEC instruction circumvents the dependency checking logic in the core. Following instructions must stall until register values for the EXEC instruction are known. This makes EXEC a low performance instruction. The MYST instruction performs much better but is limited to RI and R2 instruction formats.

Instruction Format: R2

35	29	2827	2625	24	20	19	18	14	13	12	8	7	6	0
07h ₇	~ ₂	~ ₂	~ ₅	Ta	Ra ₅	~	~ ₅	v	07h ₇					

MFBASE – Move From Base Register

Description:

This instruction moves a base register specified by Rb to register Rt.

Instruction Format:

35	29	2827	2625	24	20	19	18	14	13	12	8	7	6	0
28h ₇	0 ₂	Tb ₂	Rb ₅	0	0 ₄	Tt	Rt ₅	v	07h ₇					

Operation:

$$Rt = B[Rb]$$

Execution Units: ALU

Clock Cycles:

Exceptions: none

Notes:

MTBASE – Move To Base Register

Description:

This instruction moves register Ra to the base register identified by Rb.

Instruction Format:

35	29	2827	2625	24	20	19	18	14	13	12	8	7	6	0
29h ₇	0 ₂	Tb ₂	Rb ₅	0	Ra ₅	0	0 ₅	v	07h ₇					

Operation:

$$B[Rb] = Ra$$

Execution Units: ALU

Clock Cycles:

Exceptions: none

Notes:

MYST – Mystery Operation

Description:

This instruction performs a runtime variable operation contained as an instruction in a register. The instruction is contained in register Rd specified with the IMOD modifier is decoded and executed. MYST may take several additional clock cycles to complete depending on the instruction. The Rc, Rb and Ra fields specify source operands for the instruction. The Rt field specifies the target operand.

Instruction Format: RI

35	20	19	18	14	13	12	8	7	6	0
Constant ₁₆		Ta	Ra ₅		Tt	Rt ₅		v	1Fh ₇	

Instruction Format: R2

35	29	2827	2625	24	20	19	18	14	13	12	8	7	6	0
1Fh ₇	~ ₂	Tb ₂	Rb ₅	Ta	Ra ₅	Tt	Rt ₅	v	02h ₇					

PEEK – Peek at Queue / Stack

Description:

This instruction returns the top value into Rt from the hardware queue specified in Ra. The hardware queue position is not advanced. Unused value bits should read as zero. Used the STAT instruction to get the queue status.

Instruction Format: PEEKQ

31	26	25	20	19	14	13	8	7	0
0Ah ₆	0 ₆	Ra ₆	Rt ₆	07h ₈					

Instruction Format: PEEKQI

31	26	25	20	19	14	13	8	7	0
0Eh ₆	0 ₆	Qno ₆	Rt ₆	07h ₈					

Instruction Format: PEEKQ

Exceptions: none

PFI – Poll for Interrupt

Description:

The poll for interrupt instruction polls the interrupt status lines and performs an interrupt service if an interrupt is present. Otherwise, the PFI instruction is treated as a NOP operation. Polling for interrupts is performed by managed code. PFI provides a means to process interrupts at specific points in running software. Rt is loaded with the cause code in the low order eight bits, and the interrupt level in bits eight to eleven of the register.

Instruction Format: SYS

35	29	28	14	13	12	8	7	6	0
11h ₇	~ ₁₅			0	Rt ₅		0	07h ₇	

Clock Cycles: 1 (if no exception present)

Operation:

```

if (irq <> 0)
    Rt[7:0] = cause code
    Rt[11:8] = irq level
    PMSTACK = (PMSTACK << 4) | 10
    CAUSE = Const8
    EIP = IP
    IP = tvec[4]
  
```

Execution Units: Branch

POP – Pop from Queue / Stack

Description:

This instruction pops a value into Rt from the hardware queue specified in Ra. The hardware queue position is advanced. Unused value bits should read as zero. To check the queue status, use the STAT instruction.

Value: the value that was pushed to the queue

Instruction Format: POP

31 26 25 20	19 14	13 8	7 0
09h ₆	0 ₆	Ra ₆	Rt ₆
			07h ₈

Instruction Format: POPI

31 26 25 20	19 14	13 8	7 0
0Dh ₆	0 ₆	Qno ₆	Rt ₆
			07h ₈

Exceptions: none

Notes:

Queue #15 is the instruction trace que

PUSH – Push on Queue / Stack

Description:

This instruction pushes an N-bit value in Ra onto the hardware queue specified in Rb. Where N is implementation defined between 1 and 64 bits. To check the queue status, use the STATQ instruction.

Instruction Format: PUSH

31 26 25 20	19 14	13 8	7 0
08h ₆	Rb ₆	Ra ₆	0 ₆
			07h ₈

Instruction Format: PUSHI

31 26 25 20	19 14	13 8	7 0
0Ch ₆	Qno ₆	Ra ₆	0 ₆
			07h ₈

Instruction Format: PUSHQ

Exceptions: none

REX – Redirect Exception

Description:

This instruction redirects an exception from an operating mode to a lower operating mode. This instruction if successful jumps to the target exception handler and does not return. If this instruction fails execution will continue with the next instruction.

This instruction may fail if exceptions are not enabled at the target level.

The location of the target exception handler is found in the trap vector register for that operating mode (tvec[xx]).

The cause (cause) and bad address (badaddr) registers of the originating mode are copied to the corresponding registers in the target mode.

Instruction Format: REX

35	29	28 27	26 21	20	19 14	13	12 8	7	6	0
10h ₇	Tm ₂	~ ₅	0	Ra ₅	0	0 ₅	0	0	0	07h ₈

Tm ₂	
0	redirect to user mode
1	redirect to supervisor mode
2	redirect to hypervisor mode
3	redirect to machine mode

Clock Cycles: 4

Execution Units: Branch

Example:

```

REX 1          ; redirect to supervisor handler

; If the redirection failed, exceptions were likely disabled at the target level.

; Continue processing so the target level may complete its operation.

RTE           ; redirection failed (exceptions disabled ?)
```

Notes:

Since all exceptions are initially handled in debug mode the debug handler must check for disabled lower mode exceptions.

RTE – Return from Exception

Description:

Restore the previous interrupt enable setting and operating level and transfer program execution back to the address in the exception address register (EIP). One of sixty-four semaphore registers specified by the Rb field of the instruction may also be cleared. Semaphore register zero is always cleared by this instruction.

This instruction may be encoded to return a short distance past the exception address point. This may be useful to return to the next instruction or return to a point past inline parameters. The constant₁₂ field specifies a return offset in terms of half-bytes.

There is really only a single instruction to return from any mode for an exception. Although there are several additional mnemonics.

Instruction Format: SYS

35	29	2827	2625	24	20	19	8	7	0
13h ₇	~ ₂	Tb ₂	Rb ₅	Constant ₁₂			07h ₈		

Flags Affected: none

Operation:

PMSTACK = PMSTACK >> 4
 Semaphore[0] = 0
 Semaphore[Rb] = 0
 IP = EIP + Ra

Execution Units: Branch

Clock Cycles:

Exceptions: none

Notes:

SEI – Set Interrupt Mask

Description:

This instruction sets the interrupt mask to the level specified by Rb in the instruction and returns the previous setting in Rt.

Instruction Format: R2

35	29	2827	2625	24	20	19	18	14	13	12	8	7	6	0
17h ₇	~ ₂	Tb ₂	Rb ₅	0	~ ₅	0	Rt ₅	0	07h ₇					

STAT – Get Status of Queue / Stack

Description:

This instruction returns a queue status value into Rt from the hardware queue specified in Ra. The hardware queue position is not advanced. Unused value bits should read as zero.

63	62	61	54	53	48	47		0	9	0
Qe	Dv	~	~	~	~	~	~	~	~	Data Count

Fields

Qe: empty. If set, this bit indicates that the queue/stack is empty.

Dv: data valid. If this bit is set it indicates that valid data is present at the queue.

Dc: data count: The number of items left in the queue

Instruction Format: POP

31	26	25	20	19	14	13	8	7	0
0Bh ₆	0 ₆	Ra ₆	Rt ₆	07h ₈					

Instruction Format: POPI

31	26	25	20	19	14	13	8	7	0
0Fh ₆	0 ₆	Qno ₆	Rt ₆	07h ₈					

Exceptions: none

SYNC -Synchronize

Description:

All instructions for a particular unit before the SYNC are completed and committed to the architectural state before instructions of the unit type after the SYNC are issued. This instruction is used to ensure that the machine state is valid before subsequent instructions are executed.

Instruction Format:

35	29	2827	2625	24	20	19	18	14	13	12	8	7	6	0
1Fh ₇	0 ₂	0 ₂	0 ₅	0	0 ₄	0	0 ₅	0	07h ₇					

TLBRW – Read / Write TLB

Description:

This instruction both reads and writes the TLB. Which translation entry to update comes from the value in Ra. The update value comes from the value in Rb. Rb contains the virtual page number, ASID, and physical page number. The current value of the entry selected by Ra is copied to Rt. The TLB will be written only if bit 63 of Ra is set.

The entry number for Ra comes from virtual address bits 14 to 23.

Page numbers are in terms of a 16kB page size.

Instruction Format: SYS

35	29	2827	2625	24	20	19	18	14	13	12	8	7	6	0
1eh ₇	~ ₂	Tb ₂	Rb ₅	0	Ra ₅	0	Rt ₅	v	07h ₇					

Clock Cycles: 5

Execution Units: Memory

Ra Value Format

63	62	12	11	10	9	0
w	~				way	entry no

Rb/Rt Value Format

63	56	55	54	53	52	48	47	32	31	20	19	0
ASID	G	D	A	UCRWX	VPN				~	PPN		

Bits		Meaning
0 to 19	PPN	Physical page number
20 to 31	~	reserved (expansion of physical page number)
32 to 49	VPN	Virtual page number high address order bits 24 to 39
48	X	1 = page is executable
49	W	1 = page is writeable
50	R	1 = page is readable
51	C	1 = page is cachable
52	U	reserved for system usage
53	A	Accessed, set if translation was used
54	D	Dirty, set if a write occurred to the page
55	G	Global, global translation indicator
56 to 63	ASID	ASID address space identifier

Exceptions: none

WFI – Wait for Interrupt

Description:

The WFI instruction waits for an external interrupt to occur before proceeding. While waiting for the interrupt, the processor clock is stopped placing the processor in a lower power mode.

Instruction Format: SYS

35	29	28		7	6	0
12h ₇	~22				07h ₇	

Clock Cycles: 1 (if no exception present)

Execution Units: Branch

Vector Specific Instructions

MFILL –Mask Fill

Description

Fill vector mask register with bits.

The first Ra bits of the vector mask register (Vmt) are set to one. The remaining bits of the mask register are set to zero.

Instruction Format: R1

31 26	25 20	19 14	13 11	10 8	7 0
0Ch ₆	~ ₆	Ra ₆	0 ₃	Vmt ₃	80h ₈

Operation

Vmt = 0

for x = 0 to VLMAX

if (x < Ra) Vmt[x] = 1

Execution Units: ALUs

MFIRST – Find First Set Bit

Description

The position of the first bit set in the mask register is copied to the target register. If no bits are set the value is 128. The search begins at the least significant bit and proceeds to the most significant bit.

Instruction Format: R1

31 26	25 20	19 17	16 14	13 8	7 0
0Eh ₆	~ ₆	0 ₃	Vm ₃	Rt ₆	80h ₈

Operation

Rt = first set bit number of (Vm)

Exceptions: none

Execution Units: ALUs

MFMM – Move from Mask

Description

Move a mask register to a general-purpose register.

Instruction Format: R1

31 26	25 20	19 17	16 14	13 8	7 0
11h ₆	~ ₆	0 ₃	Vm ₃	Rt ₆	80h ₈

Operation

$V_{mt} = R_a$

Execution Units: ALUs

MFVL – Move from Vector Length

Description

Move vector length register to a general-purpose register.

Instruction Format: R1

31 26	25 20	19 17	16 14	13 8	7 0
13h ₆	~ ₆	0 ₃	0 ₃	Rt ₆	80h ₈

Operation

$V_{mt} = R_a$

Execution Units: ALUs

MLAST – Find Last Set Bit

Description

The position of the last bit set in the mask register is copied to the target register. If no bits are set the value is 128. The search begins at the most significant bit of the mask register and proceeds to the least significant bit.

Instruction Format: R1

31	26	25	20	19	17	16	14	13	8	7	0
0Fh ₆		~ ₆	0 ₃		Vm ₃		Rt ₆			80h ₈	

Operation

Rt = last set bit number of (Vm)

Exceptions: none

Execution Units: ALUs

MTM – Move to Mask

Description

Move a general-purpose register to a mask register.

Instruction Format: R1

31	26	25	20	19	14	13	11	10	8	7	0
10h ₆		~ ₆		Ra ₆		0 ₃		Vmt ₃		80h ₈	

Operation

$Vmt = Ra$

Execution Units: ALUs

MTVL – Move to Vector Length

Description

Move a general-purpose register to the vector length register.

Instruction Format: R1

31 26	25 20	19 14	13 11	10 8	7 0
12h ₆	~ ₆	Ra ₆	0 ₃	0 ₃	80h ₈

Operation

$$V_{mt} = R_a$$

Execution Units: ALUs

Arithmetic / Logical

V2BITS

Description

Convert Boolean vector to bits. The least significant bit of each vector element is copied to the corresponding bit in the target register. The target register is a scalar register.

Instruction Format: R1

35	29	28	24	23	21	20	19	18	14	13	12	8	7	0
18h ₇		~ ₅		m ₃		z	1 ₁		Ra ₅	0 ₁		Rt ₅		81h ₈

Operation

For $x = 0$ to $VL-1$

if ($Vm[x]$)

$Rt[x] = Va[x].LSB$

else if (z)

$Rt[x] = 0$

Exceptions: none

VBITS2V

Description

Convert bits to Boolean vector. Bits from a general register are copied to the corresponding vector target register.

Instruction Format: R1

35	29	28 24	23 21	20	19	18 14	13	12 8	7	0
19h ₇	~ ₅	m ₃	z	0 ₁	Ra ₅	1 ₁	Rt ₅	81h ₈		

Operation

For $x = 0$ to $VL-1$

if ($Vm[x]$) $Vt[x] = Ra[x]$

Exceptions: none

VCIDX – Compress Index

Description

A value in a register Ra is multiplied by the element number and copied to elements of vector register Vt guided by a vector mask register.

Instruction Format: R1

31 26	2524	23 21	20	19 14	13 8	7 0
2Dh ₆	~ ₂	m ₃	z	Ra ₆	Vt ₆	8lh ₈

Operation

$y = 0$

for $x = 0$ to $VL - 1$

if (Vm[x])

$Vt[y] = Ra * x$

$y = y + 1$

VCMPRSS – Compress Vector

Description

Selected elements from vector register Va are copied to elements of vector register Vt guided by a vector mask register.

Instruction Format: R1

31	26	2524	23 21	20	19 14	13 8	7	0
2Ch ₆	~ ₂	m ₃	z	Va ₆	Vt ₆	8lh ₈		

Operation

y = 0

for x = 0 to VL - 1

if (Vm[x])

Vt[y] = Va[x]

y = y + 1

VEINS / VMOVSV – Vector Element Insert

Synopsis

Vector element insert.

Description

A general-purpose register Rb is transferred into one element of a vector register Vt. The element to insert is identified by Ra.

Operation

$$Vt[Ra] = Rb$$

Exceptions: none

VEX / VMOVS – Vector Element Extract

Synopsis

Vector element extract.

Description

A vector register element from Vb is transferred into a general-purpose register Rt. The element to extract is identified by Ra.

Operation

$$Rt = Vb[Ra]$$

Exceptions: none

VSCAN

Synopsis

.

Description

Elements of V_t are set to the cumulative sum of a value in register R_a . The summation is guided by a vector mask register.

Operation

sum = 0

for x = 0 to VL - 1

$V_t[x] = \text{sum}$

if ($V_m[x]$)

sum = sum + R_a

VSLLV – Shift Vector Left Logical

Description

Elements of the vector are transferred upwards to the next element position. The first is loaded with the value zero. This is also called a slide operation.

Operation

For $x = VL-1$ to Amt

$$Vt[x] = Va[x-amt]$$

For $x = Amt-1$ to 0

$$Vt[x] = 0$$

Exceptions: none

VSRLV – Shift Vector Right Logical

Description

Elements of the vector are transferred downwards to the next element position. The last is loaded with the value zero. This is also called a slide operation.

Operation

For $x = 0$ to $VL-Amt$

$$Vt[x] = Va[x+amt]$$

For $x = VL-Amt + 1$ to $VL-1$

$$Vt[x] = 0$$

Exceptions: none

Memory Operations

CVLDx – Compressed Vector Load

Description:

Formats Supported:

Stridden Form (CVLDSx)

31	21	20	19	14	13	12	11	9	8	7	0
Const ₁₁				I	Rc ₆		A	m ₃		z	5Ch ₈

31	28	27	20	19	14	13	8	7	0
Func _{3..0}		Const ₈			Ra ₆		Vt ₆		E6h ₈

Data is loaded from memory addresses separated by the stride amount specified by register field Rc, beginning with the sum of Ra and an immediate value. Rc may specify either a register or a six-bit unsigned constant. If the vector mask bit is clear and the ‘z’ bit is set in the instruction then the corresponding element of the vector register is loaded with zero. If the vector mask bit is clear and the ‘z’ bit is clear in the instruction then the corresponding element of the vector register is left unchanged (no value is loaded from memory).

Elements are loaded only up to the length specified in the vector length register.

Operation:

```

y = 0
for x = 0 to vector length
    if Rb is a constant
        stride = Rb
    else
        stride = [Rb]
    n = stride * y
    if (Vm[x])
        Vt[y] = Memory[d+Ra + n]
        y = y + 1
for y = y to vector length
    Vt[y] = z ? 0 : Vt[y]

n = 0
  
```

Vm[x]	z	Result
0	0	Vt[x] = Vt[x] (unchanged)
0	1	Vt[x] = 0 (set to zero)
1	0	Vt[x] = memory, sign extended
1	1	Vt[x] = memory, zero extended

Indexed Form (CVLDxVX)

31	21	20	19	14	13	12	11	9	8	7	0
Const ₁₁			0	Vc ₆		A	m ₃		z	DCh ₈	

31	28	27	20	19	14	13	8	7	0
Func _{3..0}		Const ₈		Ra ₆		Vt ₆		E7h ₈	

Data is loaded from memory addresses beginning with the sum of Ra and a vector element from Vc.

Operation:

```

y = 0
for x = 0 to vector length
    if (Vm[x])
        Vt[y] = Memory[d+Ra + Vc[x]]
        y = y + 1
for y = y to vector length
    Vt[y] = z ? 0 : Vt[y]
```

Exceptions: none

CVSTx – Compressed Vector Store

Description:

Formats Supported:

Stridden Form (CVSTSx)

31	21	20	19	14	13	12	11	9	8	7	0
Const ₁₁	I	Rc ₆	A	m ₃	z	5Ch ₈					

31	28	27	26	25	20	19	14	13	8	7	0
Func _{3..0}	C ₂	Vb ₆	Ra ₆	Cnst ₆	F6h ₈						

Data is stored to memory at addresses beginning with the sum of Ra and a vector element from Vb. The store location is adjusted by a stride amount contained in Rc or a six-bit unsigned immediate.

Operation:

y = 0

for x = 0 to vector length

n = Rc * y

if (Vm[x])

Memory[d+Ra + n] = Vs[x]

if (z) Vs[x] = 0

y = y + 1

Indexed Form (CVSTxVX)

31	21	20	19	14	13	12	11	9	8	7	0
Const ₁₁	0	Vc ₆	A	m ₃	z	DCh ₈					

31	28	27	26	25	20	19	14	13	8	7	0
Func _{3..0}	C ₂	Vb ₆	Ra ₆	Cnst ₆	F7h ₈						

Data is stored to memory addresses beginning with the sum of Ra and a vector element from Vb.

Operation:

y = 0

for x = 0 to vector length

if (Vm[x])

Memory[d+Ra + Vb[y]] = Vs[x]

if (z) Vs[x] = 0

$$y = y + 1$$

Exceptions: none
